

Screw the hook into the roof above the heater where the sauna stones are.

Position the AquaDropper in a suitable height. The higher the location, the further to the side the water will fall.

Attach the included three hooks in the ring and attach the chain.

Put the upper bowl in place. Fill with water and test.

**Note!** If the AquaDropper is hanging crooked the suspension mechanism can be adjusted. Hold the bowl with one hand while grabbing the L-shaped piece and slightly bend it until it hangs straight.

The AquaDropper is now ready for use. Fill the large bowl with water. The speed of the water drop is adjusted with the set screw.

If the bowl is filled to capacity with water and the drip rate is adjusted so that the lower bowl tips over every 20 seconds, the water will last for 15 minutes. At this setting the sauna experience becomes pleasantly steam filled and suitably hot (sauna of 10 m<sup>3</sup>). However personal preferences are different from person to person, so please experiment yourself with different speeds. AquaDropper is also excellent for those who like to lie down in the sauna. In that case maybe you prefer a little less heat and moisture. The drip rate can then be easily reduced. AquaDropper can be cleaned with dish washing detergent.

## **WARNING**

during use, the metal parts are hot.

- Children should not use the product
- Remove AquaDropper after use to prevent unauthorized use of the product
- Do not touch the parts with bare hands or skin
- Be careful when filling the bowl
- If the position of the lower bowl needs to be changed, use protection for your hands or anything else that may come in contact with hot metal parts and the water
- Do not stand above the heater with any part of the body when water is poured on hot stones as the steam can be very hot
- Saline products should not be used
